P

POULTRYSTOCK

# Inventory that a shop owner can trust.

A poultry shop inventory management system

**HAROLD SUELLO | FINAL MINI CAPSTONE**

React SPA • Laravel API • MySQL

CLIENT NEED

# Replacing the notebook

A small neighborhood poultry shop: chicken, eggs, live birds, feeds and supplements

**Missing visibility**

The owner cannot see current stock or low-stock items immediately.

**Unrecorded losses**

Spoilage, breakage and mortality can be forgotten.

**Untracked restocking**

Supplier requests are not consistently approved or recorded.

**Limited accountability**

The shop needs to know who recorded each change.

SOLUTION

# Two roles. One reliable inventory.

Simple screens for staff and owner, with enforcement by Laravel

## STAFF

- View products and suppliers
- Record stock and spoilage
- Request supplier orders
- Receive approved orders

## OWNER / ADMIN

- Manage catalog and user accounts
- See all shop movements
- Approve or reject requests
- Review inventory dashboard

ARCHITECTURE

# React + Laravel + MySQL

One source of data; backend permissions and transaction safeguards

## Data relationships

**Categories + Suppliers → Products → Stock Movements**

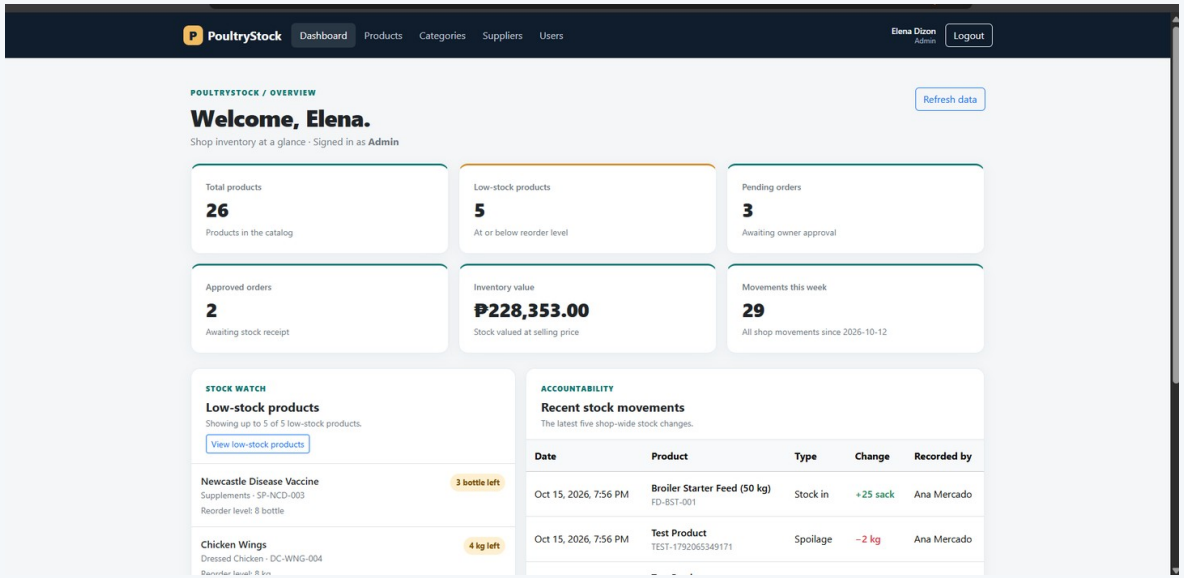

**Suppliers → Purchase Orders → Order Items → Stock receipt**

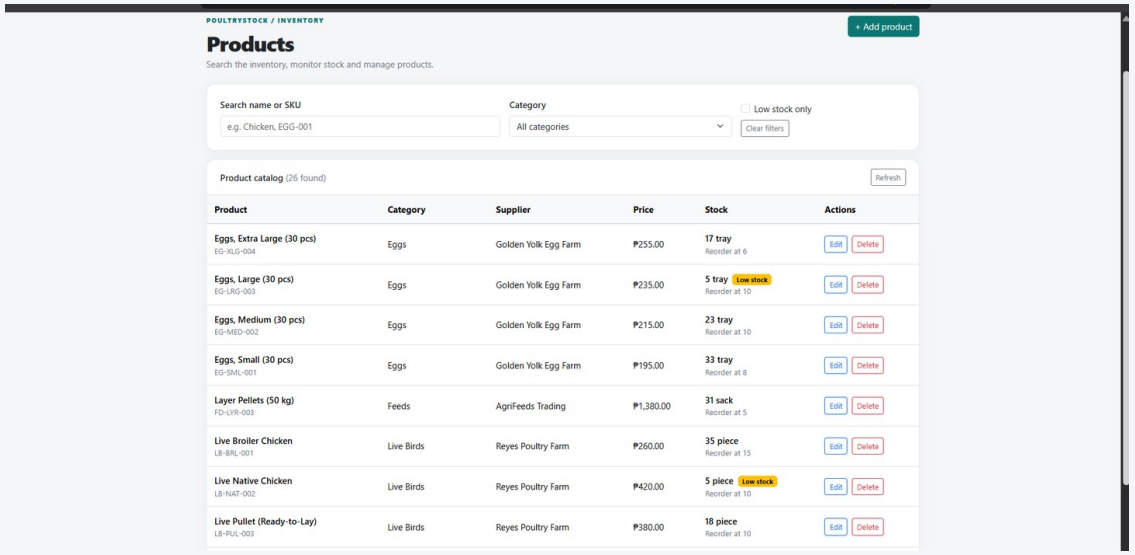

The full migration-based ERD is supplied in docs/ERD.png

LIVE DEMONSTRATION

# Inventory visibility in action

Real application screenshots; switch to the running system for the live walkthrough

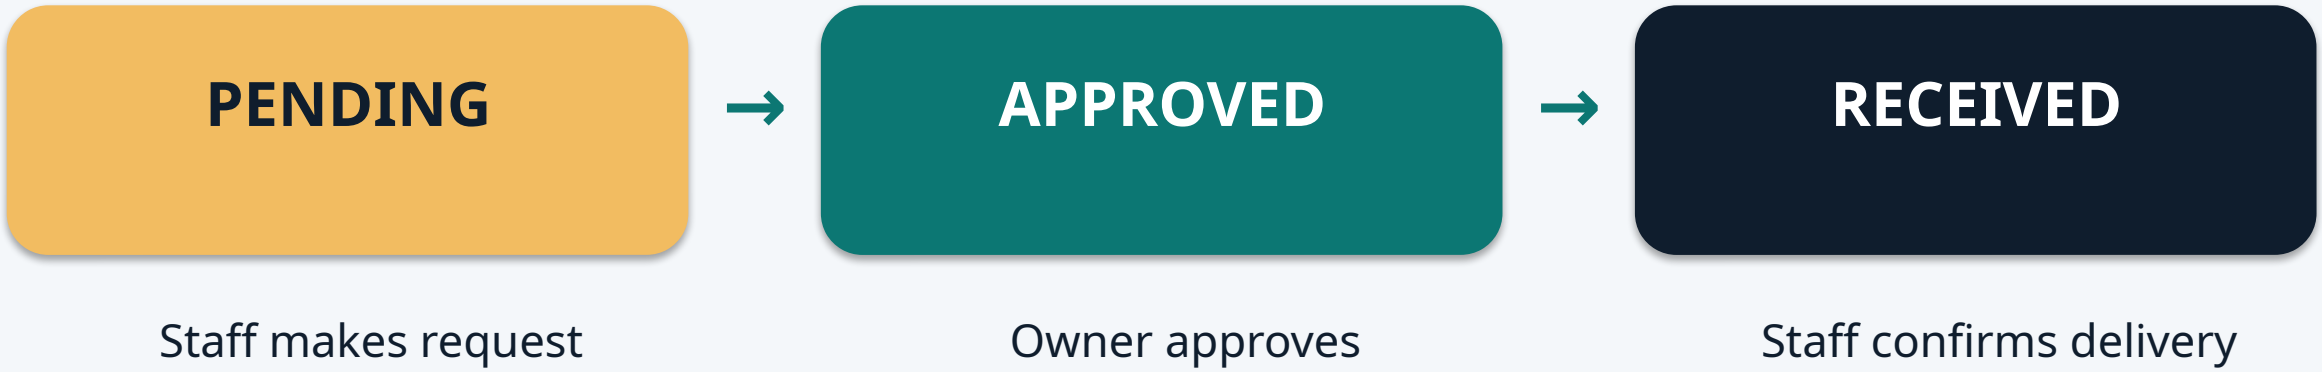

**Dashboard: metrics, low stock, recent changes**

**Products: search, filters, CRUD, pagination**

# A purchase order from request to receipt

Demonstrate this flow using two accounts

**On receipt, Laravel adds stock once and writes a stock-in movement.**

# What the shop receives

Working code, repeatable setup and documented operations

| | |
|---|---|
| **REPOSITORY** | React frontend + Laravel backend, version-controlled |
| **INSTALL GUIDE** | README with MySQL setup, both servers and demo accounts |
| **API DOCUMENTATION** | Exported Postman collection and endpoint table |
| **DATABASE MODEL** | Final ERD showing inventory and purchase-order relations |
| **DEMO BACKUP** | Recorded walkthrough and actual application screenshots |

# Delivered now. Expand later.

PoultryStock addresses inventory visibility, losses, restocking and accountability.

## DELIVERED

- Role-based records and CRUD
- Low-stock visibility and stock ledger
- Supplier approval/receipt workflow

## PHASE 2

- Barcode receiving / POS
- Supplier notifications
- Exports, deployment and backups

# Thank you.
